

- Main Idea: Something related to news or weather (possibly both)
- MVP: Is interactive, has cool data, looks good (intuitive)
- Stretch: Layers of that
- LG (Nathan): Build skills in accessing online data and creating a quality user interface
- LG (Maya): Get better at writing code that is not too specific and can be adapted and changed easily
- We're going research to find which database we use and how we manipulate it
- Mid Project Check in: one layer done(MVP)
- Other things getting in the way

One idea for a news subject frequency map.

Possibly able to sweep through time to see major events in a region.
